

# Ground-Based Remote Sensing (GBRS) activities: formulation, implementation, and accomplishments

# Ground-Based Remote Sensing (GBRS) activities: formulation, implementation, and accomplishments

## GBRS key players

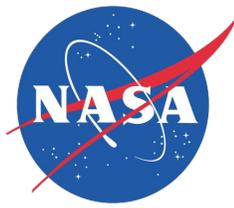

Christopher Hiemstra, Hans-Peter Marshall, Roger De Roo, Mohammad Mousavi, Francis Bliven, Walt Peterson, Jeffrey S. Deems, Peter Gadowski, Arthur Gelvin, Lucas Spaete, Theodore Barnhart, Tyler Brandt, John Burkhart, Christopher Crawford, Tri Datta, Havard Erikstrod, Nancy Glenn, Katherine Hale, Brent Holben, Paul Houser, Keith Jennings, Richard Kelly, Jason Kraft, Alexandre Langlois, Jewell Lund, Daniel McGrath, Chelsea Merriman, Noah Molotch, Anne Nolin, Chris Polashenski, Mark Raleigh, Karl Rittger, Chago Rodriguez, Alexandre Roy, McKenzie Skiles, Eric Small, Marco Tedesco, Chris Tennant, Aaron Thompson, Liuxi Tian, Zach Uhlmann, Ryan Webb, Matt Wingo

... and even more contributors who helped pulling radars, carrying gear to the field,  
and all the **transect, snowpit, and snow microstructure (SSA, SMP, snow cast) teams**  
who collected the necessary in situ data to support the ground-based remote sensing activities

## Time line

### **1 July 2016 – 28 February 2017**

July – mid Aug.:

Solicited the community/Gather information on sensors & people availability  
Selected Local Scale Observations Sites (LSOS)

mid. Aug. – Sept.:

Designed the campaign

late Sept./early Oct.:

Fall campaign (terrestrial lidar), installed LSOS and time-lapse cameras

Oct. – Jan.:

Developed the Experiment Plan, and addressed all the logistics

Feb.:

Executed the winter campaign

### **April 18-19**

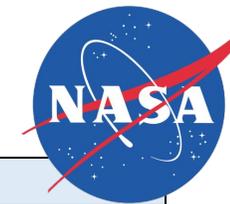

Lessons learned meeting with HQ and project office

### **May 17-20**

Disassembled LSOS

### **July 20-24**

GPS survey of the transect poles (survey grade acquisition)`

# Ground Based Remote Sensing objectives

SnowEx Overarching Question: How much water is stored in Earth's terrestrial snow-covered regions?				
SnowEx Year 1 Fundamental Questions	Q1 – What is the distribution of snow-water equivalent (SWE), and the snow energy balance, in different canopy types and densities, and terrain?			
	Q2 – What is the sensitivity and accuracy of different SWE sensing techniques in different canopy types, canopy density, and terrain?			
Mission Objective and Associated Ancillary Questions	Measurement Requirements	Instrument Functional Requirements	Investigation Functional Requirements	Data Deliverables
<p><b>1) Quantify SWE in open and forested areas for different canopy densities and terrain (Response to Q1,2)</b></p> <p>A. What is the spatial variability of SWE in open and forested areas?</p> <p>B. What factors control snow variability in open and forested areas in different terrain?</p> <p>C. What is the sensitivity &amp; accuracy of different sensors to SWE at different scales and under different canopy densities?</p>	<p>Site with a range of forest densities &amp; snow conditions, reliable &amp; dry snow, and a wide range of SWE values.</p> <p>Selected sites:</p> <ul style="list-style-type: none"> <li>Grand Mesa, Colorado is the primary site.</li> <li>Nearby Senator Beck basin added as secondary site to investigate Q1 &amp; Q2 in complex terrain.</li> </ul> <p>Multi-sensor airborne measurements at a spatial scale &lt;200 m to measure:</p> <p><i>Snow water equivalent</i></p> <ul style="list-style-type: none"> <li>Microwave emission</li> <li>Radar backscatter time series</li> <li>Interferometric phase change</li> </ul> <p><i>Snow depth</i></p> <ul style="list-style-type: none"> <li>Waveform LiDAR</li> </ul> <p><i>Spectral BRDF, Albedo</i></p> <ul style="list-style-type: none"> <li>Hyperspectral VIS/SWIR reflected radiance</li> </ul> <p><i>Snow areal extent</i></p> <ul style="list-style-type: none"> <li>VIS/NIR imagery (multi- or hyperspectral)</li> <li>High-res digital photography</li> </ul> <p>Concurrent <i>in situ</i> ground truth measurements of micro- and macro-snow &amp; forest properties</p> <ul style="list-style-type: none"> <li>Depth, density, SWE</li> <li>Grain size &amp; morphology,</li> <li>Snow surface roughness</li> <li>Snow stratigraphy</li> <li>Snow temperature profile</li> <li>Forest litter content in the snow surface layer</li> </ul>	<p><u>LiDAR</u></p> <p>Full-waveform LiDAR system with &lt;1.0 m horizontal resolution and &lt;0.10 m vertical accuracy.</p> <p><u>Active microwave</u></p> <p>Dual-pol radar (10 &amp; 17 GHz) with spatial resolution of &lt;10 m and a swath width of &gt;100 m, Backscatter sigma 0 to -20 dB</p> <p><u>Passive microwave</u></p> <p>Dual-polarized microwave radiometer (minimum bands: 10, 18, &amp; 37 GHz); spatial resolution &lt;200 m, <math>T_b</math> accuracy of <math>\pm 2K</math></p> <p><u>Vis/IR</u></p> <p>Multi-spectral/multi-angular high resolution radiometer (iFOV: &lt;5°, spectral range: UV–NIR <math>\mu m</math>: absolute accuracy: &lt;5%).</p> <p>VIS/NIR imaging spectrometer (FOV <math>\leq 40^\circ</math>, spectral range 400–1050 nm, iFOV &lt; 1mrad)</p> <p>Imaging IR sensor and remote thermometer (sensor accuracy <math>\pm 1K</math>)</p> <p>High res digital nadir camera</p> <p><u>L-band InSAR</u></p> <p>L-Band frequency (~ 1.25 GHz)</p> <p>Dual-polarized or quad polarized &lt;10° phase sensitivity</p> <p>&lt;5 m horizontal resolution</p> <p><u>Ground Truth</u></p> <p>SWE accuracy: 2cm (SWE &lt;20cm), 10% (SWE &gt;20cm)</p> <p>Snow density accuracy: 20 kg/m<sup>3</sup> or 2%</p> <p>Snow depth accuracy: 3 cm</p> <p>Snow temperature: 1°C.</p> <p>Snow grain size: 0.2 mm (&lt;1 mm), 1 mm (1-15 mm)</p>	<p>Field location representing gradients of forest density on relatively flat terrain and location with complex terrain to test all RS techniques.</p> <p>Airborne platform(s) with flexible range and altitude capabilities matching optimum sensing altitudes (e.g., 1000-6000 ft AGL), with capacity for multiple instruments and flight profiles</p> <p>Fully coordinated airborne and in-situ snow surveys at nested scales during the field season</p> <p>Temporal resolution — daily ground observations during airborne observations (at least 2 8hr-flights per week) at least two weeks in winter.</p> <p>Physical, empirical, and/or statistical snow distribution models to scale ground measurements to airborne and satellite remote sensing scales</p> <p><u>Models</u></p> <ul style="list-style-type: none"> <li>Spatial scaling models</li> <li>Radiative transfer and scattering models</li> <li>Snowpack physical models including snow redistribution and interception components</li> <li>Snow physical models (secondary) Hydrology / climate models</li> <li>SWE retrieval algorithms</li> </ul>	<p><u>Ground Obs. # Experiment Plan

## SnowEx Experiment Plan for TLS activities during SnowEx 2016 - 2017

This document explains and justifies why the following measurements are relevant to the SnowEx mission, and it summarizes all the work that will be done at both Grand Mesa and Senator Beck with TLS units. It refers directly to the Science Traceability Matrix.

## Background on TLS activities

*A brief section with some generalities and recent references to highlight work achieved in the field. Schematics/pictures showing the instrument and/or measuring techniques are encouraged.*

## Scientific goals

*A prioritized, detailed section with everything that will be addressed using radar measurements and why it is relevant to SnowEx.*

## Measurement characteristics

*Detailed explanations of the measurement characteristics (number, locations, etc.) for each scientific goal stated in the experiment plan. These measurements will be grouped by tiers to ease prioritizations in the field in the event of delays (e.g. due to weather).*

## Instrument descriptions

### 1. Instrument 1

#### 1. Main characteristics

1. Sensor characteristics
2. Experimental design

*e.g. acquisition frequency, etc.*

3. Risks

*e.g. May produce RFI, or is sensitive to RFI at frequency X, etc.*

4. Operating in cold
5. Personnel needed
6. Other equipment needed

#### 4. Instrument's point of contact

#### 5. Protocol(s)

*Few words about calibrations for example.*

#### 4. Deliverables

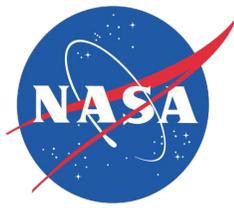

*Few words about the lowest and highest data level that will be delivered to NSIDC.*

#### 5. Data format

→ 40 pages of crucial information on GBRS

# Ground Based Remote Sensing objectives

- . Obtain continuous observations throughout the winter

**The February measurements (airborne, GBRS, or in situ) offer a snapshot, without the context/history of winter**

- . Guarantee that in situ snow properties are measured where GBRS data are collected

**Remote sensing data without in situ measurements of snow properties is (still) insufficient**

- . Ensure that airborne sensors have a *GBRS equivalent*

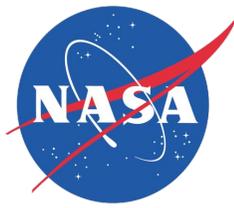

**For validation of airborne observations and retrievals, and also to address vertical scaling questions**

- . Enable observations from multiple sensors over the same sites and from different heights

**To identify which combination of sensors have the best performance for SWE monitoring**

# Ground Based Remote Sensing objectives

- . Obtain continuous observations throughout the winter

**The February measurements (airborne, GBRS, or in situ) offer a snapshot, without the context/history of winter**

- . Guarantee that in situ snow properties are measured where GBRS data are collected

**Remote sensing data without in situ measurements of snow properties is (still) insufficient**

2017 in-situ passive  
microwaves  
measurements: a  
context for SWE  
assimilation”

- . Calibration checks with ambient black body
- . Liquid nitrogen calibration
- . Mean absolute error of 1 K

- Significant TB increase due to melting snow
- Strong response of higher frequencies to the presence of liquid water
- Signal seems to saturate quickly (20 minutes)

→ Airborne observations may be impacted on warm days

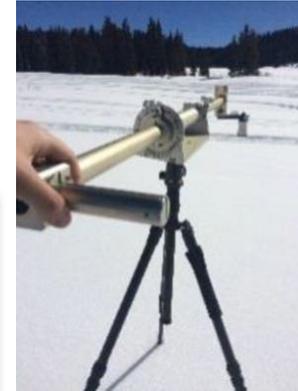

# Spectroscopy

Measurements types along transects and in front of snowpit:

- . Irradiance
- . Radiance
- . Albedo
- . Reflectance

Poster – J. Lund  
“Ground validation of spectral and broadband snow albedo from the Airborne Snow Observatory during SnowEx Year 1, Senator Beck Basin Study Area, CO”

# Thermal infra-red skin temperature measurements

SnowEx meteorological tower TIR sensors were cross-calibrated  
on Feb. 15<sup>th</sup>

LSOS (10am),  
Mesa West (12pm),  
Mesa East (2pm),  
and Mesa Middle (4pm)

TIR Field Measurements:

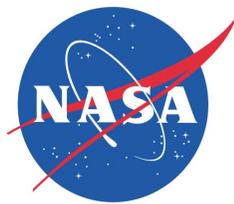

- . Skin surface temperature / blackbody temperature.
- . TIR sensor body temperature
- . Blackbody incoming/outgoing longwave radiation (8-14 $\mu$ m)

Tues. 1:45 – C.  
Crawford “An  
overview of thermal  
infrared and visible-to-  
shortwave infrared  
instrument calibration  
activities for SnowEx  
Grand Mesa”

# Snow interception by canopy – tree sway frequency

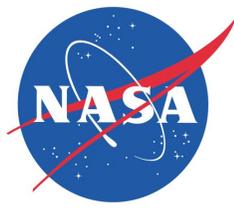

Grand Mesa: 3 trees  
Senator Beck: 2 trees

U. Colorado:  
M. Raleigh

# Ground Based Remote Sensing objectives

- . Obtain continuous observations throughout the winter

The February measurements (airborne, GBRS, or in situ) offer a snapshot, without the context/history of winter

- . Guarantee that in situ snow properties are measured where GBRS data are collected

Remote sensing data without in situ measurements of snow properties is (still) insufficient

- . Ensure that airborne sensors have a *GBRS equivalent*

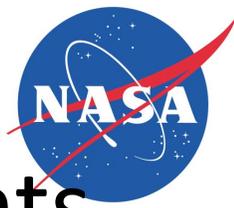

For validation of airborne observations and retrievals, and also to address vertical scaling questions

- . Enable observations from multiple sensors over the same sites and from different heights

**To identify which combination of sensors have the best performance for SWE monitoring**

# An overview of SNOWEX

## Ground-Based Remote Sensing accomplishments

- Coordinated observations of:
- . Scatterometer (X & Ku bands)
  - . Radiometer (1.4, 19, 37 GHz)
  - . Snowpits
  - . Snow microstructure data (SSA)
  - . Snow MicroPenetrometer (SMP)

- Coordinated PMW observations at different heights/scales, with:
- . Surface based systems
  - . Truck-mounted systems

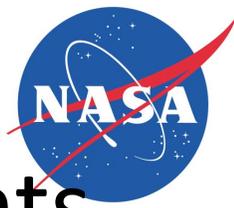

- Coordinated observations of:
- . Radar (1-6 GHz)
  - . Radiometer (11, 19, 37, 89 GHz)
  - . Wallops's Precipitation Imaging Package
  - . Snowpits, SSA, SMP
  - . Snow casts for  $\mu$ -computed tomography
